The intake pilot

A shorter review cycle, with an unanswered quality question. [1][2]

The pilot measured time; quality remains unknown [1][2]

In this synthetic intake pilot, median review time was 40 hours before the pilot and 16 hours during the pilot. The observation covered two teams over eight weeks. These are training data, not actual organizational results. [1]

The two-team intake pilot did not measure review quality or error rates. A faster review cannot establish a quality improvement. The sample does not establish an effect in other teams. [2]
